On non-Abelian holonomies

J. Alfaro, H. A. Morales-Técotl, M. Reyes and L. F. Urrutia

Abstract

We provide a method and results for the calculation of the holonomy of a Yang–Mills connection in an arbitrary triangular path, in an expansion (developed here to fifth order) in powers of the corresponding segments. The results might have applications in generalizing to Yang–Mills fields previous calculations of the corrections to particle dynamics induced by loop quantum gravity, as well as in the field of random lattices.
